Experiment 9: Exploration of AI-Enabled Capabilities Embedded in Modern No-Code Applications

Aim

To explore the artificial intelligence (AI) features available in modern no-code platforms and understand how they help application builders.

Objective

- Identify AI capabilities offered inside no-code platforms.
- Understand where each capability can be used in a business application.
- Study the benefits and the cautions of using AI.

AI Capabilities in No-Code Platforms

Capability	What it does	Business use
Text recognition (OCR)	Reads text from images and scanned documents	Auto-fill an expense form from a bill photo
Sentiment analysis	Finds whether text is positive, negative or neutral	Analyze customer feedback and complaints
Keyword extraction	Picks the main terms from long text	Tag support tickets automatically
Object detection	Identifies objects in an image	Inventory or inspection photos
Predictive models	Predicts a value from past data	Forecast sales or flag likely late payments
Natural language / copilot	Builds or edits apps from typed instructions	Create a form or report by describing it
Chatbots	Answer common questions automatically	Employee or customer help desk

Examples from Popular Platforms

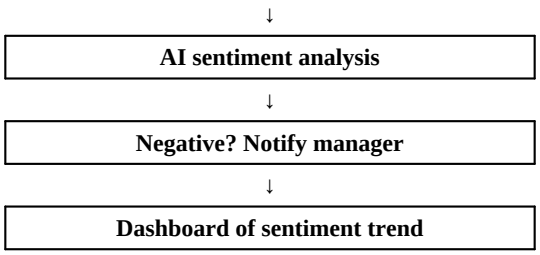

Platform	AI feature
Zoho Creator	Zia AI fields such as text recognition, sentiment analysis, keyword extraction and object detection; prediction builder
Microsoft Power Apps	Copilot to build apps with natural language; AI Builder for form processing and prediction
Google AppSheet	Gemini-based help to create apps and extract data from images and documents

Names and availability of AI features change with versions and plans, so confirm on the platform before use.

Sample Use Case

Customer Feedback App: a customer submits feedback in a form. The AI sentiment field marks it Positive or Negative; negative feedback triggers a workflow that notifies the support manager. A dashboard shows the sentiment trend by month.

Benefits

- Adds intelligence without writing machine learning code.
- Saves manual data entry and review time.
- Gives faster and data-based decisions.

Cautions

- AI results can be wrong, so important decisions need human review.
- Sensitive data must be handled according to privacy rules.
- Some AI features need higher paid plans or usage credits.

Results

Several AI capabilities embedded in no-code platforms were identified and mapped to practical business uses.

Conclusion

AI inside no-code platforms makes advanced features available to non-programmers. Used with proper review and data protection, it improves productivity and the quality of business applications.
